Analytical Equipment and Equipment for Syntheses
NMR spectra were either recorded on a Bruker DRX 500 (1H NMR: 500 MHz) or on a Bruker Advance 600 (1H NMR: 600 MHz) FT-NMR spectrometer. 1H NMR and 13C{1H} NMR spectra were referenced against the solvent residual proton signals (1H) or the solvent itself (13C). 19F NMR spectra were referenced internally against CCl3F. The exact assignment of the peaks was performed by two-dimensional NMR spectroscopy such as 1H COSY, 1H NOESY, 1H/13C HSQC or 1H/13C HMBC if possible.

1H NMR spectra for the determination of the ratio between spiropyran and merocyanine form were recorded on a Bruker Advance 600 MHz FT-NMR spectrometer. Due to the low concentration of the samples (ca. 50 µmol/L), excitation sculpting was used to suppress residual solvent lines and 1024 scans were recorded. Mass spectrometric measurements were performed in the positive ion mode using a JEOL-Accu TOF 4GGCV EI mass spectrometer, a Bruker Daltonics micrOTOF II ESI mass spectrometer or a VG Analytical Autospec apparatus for CI. Electron ionization (EI) and Chemical ionization (CI) were performed using an ionization potential of 70 eV. In the case of CI ionization, methane was used as the reagent gas.

IR spectra were measured using a Perkin Elmer Paragon 1000 FT-IR spectrometer equipped with an A531-G Golden-Gate-ATR-unit.
UV spectra were recorded at 25 °C using a Perkin Elmer Lambda 14 UV spectrometer. Quartz cuvettes with a light path length of 10 mm from Hellma Analytics were used. Melting points were measured on an electrothermal IA6304 capillary melting point apparatus and are uncorrected. The irradiation experiments were carried out using LED light sources with an optical power of 1050 mW (Nichia NC4U033A; 365 nm) and 350 mW (Luxeon LXML-PX02; 565 nm).

**Reagents**

If not noted otherwise, all reagents were used as received.

Solvents
All solvents which were purchased in technical grade were purified by evaporation prior to use. Solvents of purities higher than 99% were not purified further. Some solvents were degassed by three freeze-pump-thaw cycles, backfilled with nitrogen and stored over molecular sieve 3 Å. The following solvents were dried in a solvent purification system PS-MD-5 by Innovative Technology: dichloromethane, diethyl ether, tetrahydrofuran.

Experimental Procedures

5-Bromo-2,3,3-trimethyl-3H-indole[2] (8a)

\[
\begin{align*}
\text{Br} & \quad \text{Me}^9 \\
6 & \quad 7a & \quad N \\
5 & \quad 4 & \quad 3a \\
10 & \quad & \quad 2 \\
1 & \quad & \quad 8 \\
3 & \quad & \quad 9
\end{align*}
\]

A solution of p-bromophenylhydrazine hydrochloride (1.50 g, 6.72 mmol), 3-methyl-2-butanone (1.16 g, 13.4 mmol) in dry glacial AcOH (120 mL) was heated to 130 °C under a nitrogen atmosphere for 6 h. The reaction mixture was allowed to cool to ambient temperature and subsequently the solvent was removed under reduced pressure. After dissolving the residue in Et₂O (150 mL) and addition of water (100 mL), the aqueous layer was extracted with n-hexane (2 × 100 mL) and Et₂O (1 × 150 mL). The organic phases were combined and washed with KOH (10%, 3 × 100 mL) and water (3 × 100 mL). Removal of the solvent and drying in vacuo gave the product as dark brown oil (1.34 g, 5.65 mmol, 84%, Lit.[2] 97%).

\[\text{\textsuperscript{1}H NMR} \ (500 \text{ MHz, CDCl}_3): \delta = 7.42 - 7.36 \text{ (m, 3H, } H-4, H-6, H-7) \], 2.25 (s, 3H, } H-8), 1.28 (s, 6H, } H-9, H-10) \text{ ppm.}\]

\[\text{\textsuperscript{13}C NMR} \ (126 \text{ MHz, CDCl}_3): \delta = 188.6 \text{ (C-2), 152.8 (C-5), 147.9 (C-7a), 130.8 (C-4), 125.0 (C-6), 121.4 (C-7), 119.0 (C-3a), 54.3 (C-3), 23.1 (C-9, C-10), 15.5 (C-8) ppm.}\]

\[\text{IR (ATR): } \tilde{\nu} = 2964 \text{ (m), 2927 (w), 1574 (s), 1462 (m), 1446 (s), 1416 (m), 1376 (m), 1315 (w), 1245 (m), 1199 (m), 1083 (w), 1051 (w), 937 (w), 866 (m), 821 (vs), 707 (w), 677 (m), 634 (w), 537 (m) cm}^{-1}.\]

\[\text{HRMS (EI-TOF): } m/z (\%) : [M]^+ \text{ calcd for } [C_{11}H_{12}^{79}\text{BrN}]^+ 237.0153; \text{ found 237.0145 (98); calcd for } [C_{11}H_{12}^{81}\text{BrN}]^+ 239.0133; \text{ found 239.01411 (100); 231.99 (80) [M-CH}_3]^+; 170.97 (83) [M-C(CH}_3)_2C(CH}_3]^+}.\]

5-Bromo-1,2,3,3-tetramethyl-3H-indolium iodide (3a)

\[
\begin{align*}
\text{Br} & \quad \text{Me}^9 \\
6 & \quad 7a & \quad N^+ \\
5 & \quad 4 & \quad 3a \\
10 & \quad & \quad 2 \\
1 & \quad & \quad 8 \\
3 & \quad & \quad 9
\end{align*}
\]

5-Bromo-2,3,3-trimethyl-3H-indole (1.34 g 5.65 mmol) was dissolved in iodomethane (15.0 mL, 240 mmol) and heated to 45 °C for 9 h. After allowing the reaction mixture to cool to ambient temperature, the dispersion was diluted with Et₂O (1 × 15 mL), filtered and rinsed with Et₂O (1 × 15 mL) to yield 5-bromo-1,2,3,3-tetramethyl-3H-indolium iodide as light purple solid (1.87 g, 4.92 mmol, 87%).

\[\text{The } \text{\textsuperscript{1}H NMR data are in agreement with reference[2]. Further data were not provided in this reference.}\]

SI-6
Melting point: $T = 245 \, ^\circ C$.

$^1$H NMR (500 MHz, DMSO-$d_6$): $\delta = 8.16$ (s, 1H, $H$-4), 7.88-7.84 (m, 2H, $H$-6, $H$-7), 3.95 (s, 3H, $H$-8), 2.75 (s, 3H, $H$-9), 1.53 (s, 6H, $H$-10, $H$-11) ppm.

$^{13}$C NMR (126 MHz, DMSO-$d_6$): $\delta = 196.6$ (C-2), 143.9 (C-3a), 141.4 (C-7a), 131.7 (C-7), 126.7 (C-4), 122.6 (C-5), 117.1 (C-6), 54.2 (C-3), 34.8 (C-8), 21.5 (C-10, C-11), 15.5 (C-9) ppm.

IR (ATR): $\tilde{\nu} = 3042$ (w), 2966 (m), 2926 (w), 2869 (w), 1628 (m), 1606 (m), 1583 (m), 1532 (m), 1460 (s), 1381 (m), 13042 (w), 2966 (m), 2926 (w), 2869 (w), 1628 (m), 1606 (m), 1583 (m), 1532 (m), 1381 (m).

HRMS (ESI-TOF): $m/z$ (%): [M+H]$^+$ calcd for $[C_{12}H_{15}BrN]^+$ 252.0382; found 252.0382 (100); calcd for $[C_{12}H_{15}^{81}BrN]^+$ 254.0367; found 254.0362 (99).

5-iodo-2,3,3-trimethyl-3H-indole (8b)

4-iodophenylhydrazine (1.30 g, 5.55 mmol), 3-methyl-2-butanone (956 mg, 11.1 mmol) and dry glacial AcOH (30 mL) were heated to 130 °C under a nitrogen atmosphere for 3 h. After allowing the reaction mixture to cool to ambient temperature, the solvent was removed in vacuo and the residue was dissolved in Et$_2$O (150 mL) and water (100 mL) was added. After phase separation, the aqueous phase was extracted with n-hexane (2 x 100 mL) and Et$_2$O (1 x 100 mL). The combined organic phases were then washed with aqueous KOH solution (10%, 3 x 100 mL) and water (3 x 100 mL). After drying over MgSO$_4$, the solvent was removed and the remaining product was dried in vacuo to give a dark brown oil (1.35 g, 4.73 mmol, 85%).

$^1$H NMR (500 MHz, CDCl$_3$): $\delta = 7.62$ (dd, $^3J = 8.1$ Hz, $^4J = 1.7$ Hz, 1H, $H$-6), 7.59 (d, $^4J = 1.7$ Hz, 1H, $H$-4), 7.29 (d, $^3J = 8.1$ Hz, 1H, $H$-7), 2.27 (s, 3H, $H$-8), 1.29 (s, 6H, $H$-9, $H$-10) ppm.

$^{13}$C NMR (126 MHz, CDCl$_3$): $\delta = 188.6$ (C-2), 153.2 (C-5), 148.2 (C-7a), 136.9 (C-6), 130.8 (C-4), 121.9 (C-7), 90.2 (C-3a) 54.2 (C-3), 23.1 (C-9, C-10), 15.5 (C-8) ppm.

IR (ATR): $\tilde{\nu} = 3042$ (m), 2968 (s), 2931 (w), 2867 (s), 1572 (s), 1460 (s), 1445 (s), 1258 (s), 1200 (s), 878 (m), 861 (m), 820 (s), 805 (w) cm$^{-1}$.

HRMS (ESI-TOF): $m/z$ (%): [M+H]$^+$ calcd for $[C_{11}H_{12}N+H]^+$ 286.0087; found 286.0091 (100).

---

$^a$ This compound has been prepared previously by different routes in yields of 79%[3], 81%[4], 96%[5] and 94%[6], respectively. $^1$H NMR data agree with reported values of references[4,6], but not with references[3,5]. $^{13}$C NMR data are in agreement with the reported values of references[3,5] references[4,6] did not provide $^{13}$C NMR data. HRMS and IR data were not reported by these references.
5-Iodo-1,2,3,3-tetramethyl-3H-indolium iodide (3b)

![Chemical Structure](image)

5-Iodo-2,3,3-trimethyl-3H-indole (1.35 g, 4.73 mmol) was dissolved in iodomethane (15.0 mL, 240 mmol) and heated to 45 °C for 15 h. After allowing the reaction mixture to cool to ambient temperature and filtration and washing with Et₂O (2 mL), the product was obtained as light brown solid (1.75 g, 4.09 mmol, 86%).

**Melting point:** \( T = 255 \) °C.

**a** This compound has also been prepared via a different route in a yield of 91%[8]. **1H NMR, 13C NMR, HRMS and mp data are in agreement with reference[8]. IR data were not reported. In reference[9], no analytical data were reported.
5-Hydroxy-1,2,3,3-tetramethyl-3H-indolium iodide[8] (3c)

5-Hydroxy-2,3,3-trimethyl-3H-indole (2.37 g, 13.5 mmol) was dissolved in iodomethane (25.0 mL, 400 mmol) in a nitrogen atmosphere and heated at 50 °C for 17 h. After allowing the reaction mixture to cool to ambient temperature, the dispersion was diluted with Et₂O (10 mL) and filtered. After drying in vacuo, 5-hydroxy-1,2,3,3-tetramethyl-3H-indolinium iodide was obtained as a brown solid (4.02 g, 12.7 mmol, 94%, Lit.[8] 64%) without further purification.

Melting point: T = 242 °C.

1H NMR (500 MHz, DMSO-d₆): δ = 10.24 (s, 1H, OH), 7.68 (d, 3J = 8.7 Hz, 1H, H-7), 7.12 (d, 4J = 2.3 Hz, 1H, H-4), 6.94 (dd, 3J = 8.7 Hz, 4J = 2.3 Hz, 1H, H-6), 3.90 (s, 3H, H-8), 2.67 (s, 3H, H-9), 1.47 (s, 6H, H-10, H-11) ppm.

### 3-Bromo-2-hydroxy-5-nitrobenzaldehyde (2a)

![Chemical Structure](image)

3-Bromo-2-hydroxybenzaldehyde (9.00 g, 44.8 mmol) was dissolved in glacial AcOH (225 mL) and cooled to 15 °C. A mixture of glacial AcOH and fuming nitric acid (1/1 v/v; 3.75 mL) was added over the course of 30 min while the internal temperature was kept at 15 °C. Then the reaction mixture was stirred at 15 °C for another 1 h. Subsequently, the cooling bath was removed and the reaction stirred for 18 h at 35 °C. After diluting the solution with water (200 mL), the formed yellow precipitate was filtered and washed with AcOH (20 mL). Subsequent crystallization from DCM/n-hexane (100 mL/100 mL) gave the product as yellow solid (6.47 g, 26.3 mmol, 59%).

**Melting point:** $T = 144$ °C.

**¹H NMR** (500 MHz, CDCl₃): $\delta = 12.23$ (s, 1H, $OH$), 9.98 (s, 1H, $H$-$7$), 8.69 (d, $^4J = 2.6$ Hz, 1H, $H$-$4$), 8.54 (d, $^4J = 2.6$ Hz, 1H, $H$-$6$) ppm.

**¹³C NMR** (126 MHz, CDCl₃): $\delta = 195.1$ (C-$7$), 163.1 (C-$2$), 140.8 (C-$5$), 134.6 (C-$4$), 128.4 (C-$3$), 119.6 (C-$1$), 112.5 (C-$1$) ppm.

**IR** (ATR): $\tilde{\nu} = 3300$ (w), 3022 (w), 2856 (m), 2755 (w), 1644 (vs), 1613 (s), 1537 (s), 1426 (s), 1339 (s), 1283 (s), 1210 (s), 1162 (s), 1096 (s), 947 (s), 918 (s), 902 (s), 759 (s), 742 (vs), 714 (vs), 694 (vs), 488 (m), 478 (m) cm⁻¹.

**HRMS** (EI-TOF): $m/z$ (%): [M]$^+$ calcd for [C₇H₅₇⁹BrNO₄]$^+$ 244.9324; found 244.9316 (100); calcd for [C₇H₅₈¹BrNO₄]$^+$ 246.9303; found 246.9296 (98); 216.94 (13) [M-CO]$^+$.
To a stirred solution of 2-iodophenol (15.0 g, 68.2 mmol) in dry THF (340 mL), anhydrous MgCl₂ (12.9 g, 136 mmol), dry TEA (18.9 mL, 13.8 g, 136 mmol) and paraformaldehyde (8.20 g, 273 mmol) were added under an atmosphere of dry nitrogen. The reaction mixture was heated to reflux for 12 h. The color of the reaction mixture changed from colorless via yellow to a reddish ochre. After cooling to 20 °C, Et₂O (200 mL) was added. After phase separation, the organic phase was washed with hydrochloric acid (2 N, 3 x 150 mL), water (1 x 150 mL) and brine (1 x 150 mL). The hydrochloric washings were combined and extracted with Et₂O (1 x 200 mL). The organic phases were combined and after drying over MgSO₄, the solvent was removed in vacuo. The residue was taken up with EtOAc (40 mL), crystallized at -20 °C and filtered. The filtrate was concentrated in vacuo and recrystallized another time from EtOAc (10 mL). The product was obtained as yellow crystals (8.20 g, 33.1 mmol, 49%, Lit.[10] 84%).

Melting point: T = 72 °C.

¹H NMR (500 MHz, CDCl₃): δ = 11.82 (s, 1H, OH), 9.77 (s, 1H, H-7), 8.00 - 7.98 (m, 1H, H-4), 7.58 (dd, ³J = 7.7 Hz, ⁴J = 1.6 Hz, 1H, H-6), 6.84 (at, ³J = 7.7 Hz, 1H, H-5) ppm.

¹³C NMR (126 MHz, CDCl₃): δ = 196.1 (C-7), 160.6 (C-2), 146.3 (C-4), 134.1 (C-6), 121.8 (C-3), 120.7 (C-5), 85.6 (C-1) ppm.

IR (ATR): ν = 3061 (w, b), 3022 (w), 2853 (m), 1639 (vs), 1603 (s), 1469 (m), 1431 (s), 1382 (s), 1296 (s), 1282 (s), 1264 (s), 1213 (s), 1170 (s), 1117 (vs), 892 (s), 730 (vs), 662 (vs), 585 (vs) cm⁻¹.

Hydroxy-3-iodo-5-nitrobenzaldehyde (2b)

¹H NMR, ¹³C NMR, IR and mp data are in agreement with reference[10]. HRMS data were not reported.
2-Hydroxy-3-iodobenzaldehyde (8.20 g, 33.1 mmol) was dissolved in glacial AcOH (160 mL) and cooled to 15 °C. A mixture of glacial AcOH and fuming nitric acid (1/1 \( v/v \); 5.52 mL) was added over the course of 30 min while the internal temperature was kept at 15 °C and then the reaction mixture was stirred at 15 °C for another 1 h. The solution turned dark red. Subsequently, the cooling bath was removed and the reaction stirred at 40 °C for 14 h. After diluting with water (160 mL), the solution was filtered. The filtrate was diluted with more water (160 mL) and filtered again. The combined precipitate were washed with Et\(_2\)O (30 mL), giving a yellow powder which was dried \textit{in vacuo} to obtain the product (3.80 g, 13.0 mmol, 39%).

**Melting point:** \( T = 150 ^\circ \text{C} \).

5'-Bromo-8-trifluoromethylsulfonyl-1',3',3'-trimethyl-6-nitrospiro[chromene-2,2'-indoline] (9j)

Trifluoromethanesulfonic anhydride (2.85 g, 10.0 mmol) was added to a solution of 5'-bromo-8-hydroxy-1',3',3'-trimethyl-6-nitrospiro[chromene-2,2'-indoline] (3.50 g, 8.39 mmol) and anhydrous pyridine (2.6 mL) in anhydrous DCM (33 mL) over the course of 10 min at 0 °C under a nitrogen atmosphere. The reaction mixture was stirred at 0 °C for 1.5 h, the cooling bath was removed and the reaction mixture stirred at 24 °C for 1 h before heating it to 40 °C for 2 h. The reaction mixture was purified by filtration through silica gel (elucent: EtOAc) and after removal of the solvent in vacuo, the residue was dissolved in toluene (20 mL) and dried in vacuo again to remove remaining pyridine as azeotropic mixture to give the product as dark blue solid (3.42 g, 6.22 mmol, 74%).

Melting point: T = 195 °C.

¹H NMR (500 MHz, CDCl₃, 300 K): δ = 8.06 (d, 4J = 2.6 Hz, 1H, H-5), 7.99 (d, 4J = 2.6 Hz, 1H, H-7), 7.29 (dd, 3J = 8.2 Hz, 4J = 2.0 Hz, 1H, H-6'), 7.17 (d, J = 2.0 Hz, 1H, H-4'), 7.01 (d, J = 10.5 Hz, 1H, H-4), 6.43 (d, 3J = 8.2 Hz, 1H, H-7'), 5.98 (d, 3J = 10.5 Hz, 1H, H-3), 2.72 (s, 3H, H-12'), 1.31 (s, 3H, H-13'), 1.22 (s, 3H, H-14') ppm.

---

a The color suggested that the compound was obtained in the merocyanine form, but in CDCl₃, which was used for NMR spectroscopy, a mixture of spiropyran:merocyanine was detected in a ratio of 1:0.14 (in the plotted spectrum, 5 peaks of the merocyanine species which do not overlay with spiropyran peaks were integrated).

b The carbon atom of the trifluoromethanesulfonic ester (C-9) was not detectable via ¹³C NMR spectroscopy, due to the large coupling constant of approx. 400 Hz, the quadruplet peaks are expected to be distributed over a range of 13 ppm and be lower in their intensity.

5'-Trifluoromethylsulfonyl-8-bromo-1',3',3'-trimethyl-6-nitrospiro[chromene-2,2'-indoline] (9l)
Trifluoromethanesulfonic anhydride (500 mg, 1.77 mmol) was added to a solution of 5'-bromo-8-hydroxy-1',3',3'-trimethyl-6-nitrospiro[chromene-2,2'-indoline] (417 mg, 1.00 mmol) and anhydrous pyridine (0.4 mL, 396 mg, 5 mmol) in anhydrous DCM (10 mL) over the course of 6 min at 0 °C. The reaction mixture was stirred at 0 °C for 1.5 h, before the cooling bath was removed and the reaction mixture stirred at 24 °C for 1 h followed by heating it to 40 °C for 2 h. After the reaction cooled down, the mixture was diluted with DCM (10 mL) and the remaining anhydride was deactivated by addition of water (20 mL). The phases were separated, the aqueous phase was extracted with DCM (2 x 10 mL) and the solvent was removed in vacuo. The remaining solid was dissolved in EtOAc (20 mL), which was then washed with hydrochloric acid (1 mol/L, 2 x 20 mL) and water (20 mL). After drying over MgSO₄ and removal of solvent, the crude product was dissolved in chloroform (20 mL) and the solution was filtered. Removal of the solvent gave the product as dark purple solid (239 mg, 435 µmol, 43%).

**Melting point:** $T = 87$ °C.

UV/vis Measurements and Determination of Attenuation Coefficients by $^1$H NMR Spectroscopy

Sample Preparation
Of each new spiropyran, a stock solution was prepared in acetonitrile (HPLC-grade, 100 mL, circa 0.1 mmol/L). A defined volume (1 – 5 mL) was taken out of this solution and diluted to give a final volume of 10 mL to obtain the desired various sample concentrations (circa 10 – 50 µmol/L).

For the determination of the ratio between the spiropyran and merocyanine species in a dark environment by $^1$H NMR spectroscopy, 500 µL of the most concentrated solution (circa 50 µmol/L) and 50 µL of deuterated acetonitrile were combined.

Table I: Preparation of stock solutions.

Summarized Results
For all new spiropyrans, 5 different dilutions were investigated by UV/vis spectroscopy under the following conditions: (a) after illumination with green light (565 nm), until a photostationary state was reached, in which mostly spiropyran form was present; (b) after irradiation with UV light (365 nm), until a photostationary state was reached, in which the merocyanine forms are enriched; (c) after keeping the sample solutions dark for at least 24 hours, the measurement was carried out under red light (i.e. no absorption possible); (d) time dependent measurements after
PSS\textsuperscript{365}; typically, 120 scans were taken with a time interval of less than 2 min\textsuperscript{a} (e) time dependent measurements after PSS\textsuperscript{565}, typically, 120 scans were taken with a time interval of 6 min\textsuperscript{b}.

The graphs (a-c) contain a plot of the measured intensities at the absorption maxima and a linear fit; the results are summarized in table ii. Plots of time dependent measurements (d, e) contain a plot of the measured absorption at the maximum which corresponds to the merocyanine state and an exponential fit. These results are summarized in table iii.

For the determination of the ratio between merocyanine and spiropyran, \textsuperscript{1}H NMR spectra of the most concentrated samples from (c) were recorded and plotted in (f). The signals used to determine the ratio are marked with green (merocyanine) and orange (spiropyran) boxes. Table iv shows the obtained results.

\textsuperscript{a} The intervals were: 2 min for 9a, 1 min for 9b, d, e, m, 15 s for 9c, f, l.
\textsuperscript{b} For 9b and 9e, 2 min and 1 min were used, respectively.
Table ii: Absorption maxima and calculated attenuation coefficients from a linear fit (using a fixed intercept at 0;0) including errors.

Table iii: The half-life times $t_{1/2}$ refer to samples, which, after illumination, were allowed to isomerize in the dark. The absorption maximum of merocyanine was plotted in dependence on time, before an exponential fit ($y = y_0 + A_1 e^{-x/t_1}$) was applied.

a A decay measurement was not performed, because the concentration of merocyanine was lower at the PSS$_{365}$ compared to dark conditions. This is because the merocyanine form also absorbs at this wavelength, leading to the formation of the spiropyran form, an effect that is not present in the dark equilibrium.

b A decay measurement was not performed, because the concentration of merocyanine at the PSS$_{565}$ was the same compared to dark conditions.
Table iviv: Determination of the absolute attenuation coefficient $\varepsilon_{MC}$ of merocyanine form by combined UV/vis and $^1$H NMR spectral analysis and calculation of the ratio between merocyanine and spiropyran forms in the photostationary state after irradiation with 365 nm for 30 sec.
