10 **Abstract**  
11  
12  
13

14 This paper argues for rethinking economic geographical of sharing and making in  
15 light of the recent proliferation of open innovation, makerspaces and maker  
16 movements. Using empirical research from an example of one such makerspace -  
17 Manchester's FabLab - and engaging with a range of geographical literatures on  
18 making, sharing economies, and digital fabrication, we develop a critical account of  
19 sharing in principle and in practice. The portrayal of open innovation spaces, such as  
20 FabLabs, as novel makerspaces of alterity and sharing is a common and underpinning  
21 theme in both academic and marketing literature (Aldrich, 2014; Anderson, 2012;  
22 Doherty, 2012, Gershenfeld, 2005; Fab Foundation 2012; Suire, 2019). However, our  
23 findings suggest that the values espoused by the FabLab, of involvement, connection  
24 and affinity are quite literally being revised and rejected by makers who use the space.  
25 Time, labour and knowledge were for the most part described by participants as  
26 precious commodities to be savoured rather than shared. Thus, while sharing is an  
27 ordinarily economic practice, this does not mean it is always, inevitably or evenly  
28 employed by economic actors and communities, especially within counter-cultural  
29 networks. If these are to be the economies of the future, we implore economic  
30 geographers to critically engage further with the complexities of and within maker  
31 spaces.

## 1. Introduction

The proliferation of sites of ‘open innovation’, including ‘open workshops’, hackerspaces, makerspaces, FabLabs, living labs and urban laboratories has attracted burgeoning attention from within in beyond academia. Brook (2011:1) claims that “hackerspaces are the digital-age equivalent of English Enlightenment coffee houses. They are places open to all, indifferent to social status, and where ideas and knowledge hold primary value’. Social scientists have shown particular interest in the products produced (Walter-Herrmann and Büching, 2013, Stacey, 2014; Suire 2019), educational uses (Schelhowe, 2013; Halverson and Sheridan, 2014) and contribution to a ‘third industrial revolution’ (Aldrich, 2014, Laplume *et al.* 2016). Within geography the focus has been upon these sites as localised spaces in which innovation, making and creativity occurs (see for example Capdevila, 2017, Schmidt and Brinks, 2017; Schmidt 2019). While there is indeed plenty of scope for learning more about the economic and social possibilities and outcomes for entrepreneurs and local communities from these spaces, this paper pauses to reflect upon a key assumption undermining much research – that these spaces are sites of sharing. Wrapped up in discourses around ‘open innovation’ there are often explicit or implicit references made to ‘sharing’, but without sufficient critique or empirical research as to what this involves in practice.

This paper positions our empirical research on Manchester's FabLab within literatures on sharing economies and maker movements. We develop emerging literature that argues for sharing as an established part of many existing economic activities, rather than as an alternative economic principle (Belk 2007, Frenken and Schor 2017, Hall and Ince 2018). The portrayal of open innovation spaces, such as FabLabs, as novel

1  
2  
3 makerspaces of alterity and sharing is a common and underpinning theme in both  
4  
5 academic and marketing literature. It has led to assumptions, too, that the  
6  
7 underpinning ethos and activities are also based on sharing and innovation, in many  
8  
9 different forms. However, we show this not to be the case in practice. We argue for  
10  
11 the importance of applying a critical geographical framework to this contemporary  
12  
13 phenomena and to emphasise that sharing (and making) are varied in definition and  
14  
15 form.  
16  
17  
18  
19  
20

21 The paper is structured thus: the theoretical section of the paper examines sharing  
22  
23 economies and making in the context of open innovation spaces, including FabLabs.  
24  
25 The review of literature identifies limitations in the criticality of existing  
26  
27 understandings of the practices of sharing and making. Section 3 outlines the  
28  
29 methodological approach taken. Our findings are presented in Section 4, structured  
30  
31 around our three key findings, i) envisioning sharing and making in the FabLab, ii)  
32  
33 spaces of sharing in and beyond the FabLab, and iii) obstacles to sharing in the  
34  
35 FabLab. The final section presents our conclusions, raises questions about the  
36  
37 sustainability of the FabLab model and develops reflections on future research  
38  
39 avenues in the fields of making and sharing.

## 47 **2. Economic geographies of sharing and making**

48  
49  
50

51 Makerspaces are often cited as important sites of sharing and making (Aldrich, 2014;  
52  
53 Anderson, 2012; Doherty, 2012, Gershenfeld, 2005; Fab Foundation 2012; Suire,  
54  
55 2019). As such, this paper reviews existing literature on makerspaces and FabLabs,  
56  
57  
58  
59  
60

1  
2  
3 sharing economies and making and consumption and highlights the research gaps that  
4  
5 we seek to address.

### 10 **FabLab digital fabrication spaces**

11  
12 The last 15 years have witnessed the global emergence and expansion of different  
13  
14 types of open innovation spaces, providing an arena for individual and collective  
15  
16 creativity through the creation of craft-based products and experimentation with  
17  
18 business or creative ideas using innovative technologies such as 3D printing or CNC  
19  
20 [computer numerical control] milling machines (Schmidt, 2019). Such spaces are  
21  
22 described using terms such as ‘open labs’, ‘open workshops’, ‘makerspaces’,  
23  
24 ‘hackerspaces’ and ‘FabLabs’. Individuals are able to utilise new technologies and  
25  
26 digital tools to become ‘hi-tech do-it-yourselfers who are democratizing access to the  
27  
28 modern means to make things’ (Gershenfeld, 2012: 48). FabLabs are one type of  
29  
30 digital fabrication space that can be differentiated from other spaces due to their  
31  
32 origin, motivations and objectives. Emerging out of the Center for Bits and Atoms, at  
33  
34 MIT, FabLabs offer access to a range of low-cost fabricators and many of them  
35  
36 operate on a commons-based peer production approach (Benkler, 2006).  
37  
38  
39  
40  
41  
42  
43  
44

45 As for a definition, a FabLab is ‘a collection of commercially available machines and  
46  
47 parts linked by software and processes’ (Gershenfeld, 2005), including laser cutters,  
48  
49 CNC milling machines and desktop 3D printers. This enables FabLab users to design,  
50  
51 make and prototype items using digital technologies. Open access to these  
52  
53 technologies was the motivating factor for the first wave of FabLabs established in  
54  
55 2002 in India, Costa Rica, northern Norway, inner-city Boston and Ghana  
56  
57 (Gershenfeld, 2005). FabLabs can be differentiated from other types of makerspaces  
58  
59  
60

1  
2  
3 as they have open hours that are free to the public rather than the paid membership  
4 model typical of many maker or hackerspaces. They also typically have more digital  
5 equipment (such as 3D printers) and a standard core set of equipment common to all  
6 FabLabs, designed to facilitate knowledge exchange across FabLabs globally.  
7  
8  
9

10  
11  
12  
13  
14 The broader aims of the Fab Foundation (the umbrella organisation overseeing  
15 FabLabs) are that the labs are technical prototyping platforms for innovation and  
16 invention ‘providing stimulus for local entrepreneurship’ and as a platform for  
17 learning and invention: ‘a place to play, to create, to learn, to mentor, to invent’ (Fab  
18 Foundation, 2018). The emphasis on play is significant as it generates more  
19 experimental practices in the FabLabs, rather than making repeat items or micro-  
20 manufacturing. The Fab Charter – which all FabLabs adopt – lists what is in a  
21 FabLab: ‘an evolving inventory of core capabilities to make (almost) anything,  
22 allowing people and projects to be shared’; that the FabLabs are ‘a community  
23 resource, offering open access for individuals as well as scheduled access for  
24 programs’; and that one of the three most important responsibilities of FabLab users is  
25 to ‘contribute to documentation in instruction’.  
26  
27  
28  
29

36  
37  
38  
39  
40  
41  
42  
43

44 The philosophy of sharing is core to FabLabs, both in the Charter requirements of  
45 conduct and in the engagement with open design, the use of open source software and  
46 sharing of designs through open sources such as Thingiverse. Wolf et al. (2014 p. 2)  
47 highlight that ‘FabLabs have the ambition to share digital fabrication blueprints as  
48 well as operating instructions for using the machines in the worldwide community’.  
49 They hold altruistic values of open and reciprocal knowledge sharing and implicitly  
50 understand knowledge as a public assets, as a commons (Hess and Ostrom 2007a;  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Verschraegen and Schiltz, 2007). Yet, comparatively little is known about how  
4  
5 knowledge is generated and shared between makers, nor what the outcome of those  
6  
7 interactions is. This is due in part to the paucity of empirical ethnographic research on  
8  
9 the topic, which this paper seeks to address.  
10  
11  
12  
13

14 The FabLab concept has been shared and adopted in over 1,000 FabLabs globally  
15  
16 (Fab Foundation 2018). FabLabs tend to emerge organically from the bottom-up,  
17  
18 often led by a handful of motivated makers and financed typically through charity,  
19  
20 goodwill, government grants and occasionally through public-private initiatives.  
21  
22 FabLabs either emerge where sufficient interest and resources can be operationalised  
23  
24 within the local maker community or where an organisation or institution (such as a  
25  
26 charity, local government or education establishment) connects with the maker  
27  
28 community to achieve policy goals around community engagement, outreach and  
29  
30 digitisation of the economy. The deliberate lack of organisational governance of the  
31  
32 FabLabs by the Fab Foundation has resulted in diversity of business models,  
33  
34 motivations and outcomes. Yet, much extant literature (Doherty, 2012; Gershenfeld,  
35  
36 2015; Suire, 2019) treats makerspaces and FabLabs as homogenous in scope and  
37  
38 operation, and insensitive to the everyday place-based practices upon which they are  
39  
40 based.  
41  
42  
43  
44  
45  
46  
47  
48

49 Geographical sensitivities of context and place are significant, for 'while many Fab  
50  
51 Labs or makerspaces look alike, their users often create their own social rules within  
52  
53 the spaces and continuously reflect upon further elements that might be integrated into  
54  
55 or subtracted from their local spaces' (Schmidt, 2019, p. 9). The FabLabs therefore  
56  
57 strike a balance between sensitivity to place and the demands of standardisation. Hess  
58  
59  
60

1  
2  
3 (2008) claims that FabLabs share ‘a persistent type of commons-like thinking: a belief  
4 in the common good and working toward shared outcomes based on voluntary  
5 participation and reciprocity’. So while the FabLab community emphasises its  
6 altruistic and sharing nature, many questions in the literature still remain about the  
7 ways in which individuals share their knowledge, the physical space of the labs and  
8 the potential outcomes of those interactions.  
9

16  
17  
18

### 19 **Sharing and sharing economies**

20  
21  
22  
23  
24 In seeking to tackle the question of if and how makers share, we can learn from  
25 emerging literature in geography about sharing economies. It now widely  
26 acknowledged that sharing economies are incredibly varied in their definition and  
27 form, and as Acquier et al. (2017, p.1) argue, 'one of the rare points scholars agree on  
28 is how hard it is to define the sharing economy and to draw clear conceptual and  
29 empirical boundaries. The sharing economy has become a catch-all label with strong  
30 normative underpinnings'. Part of the reason for this definitional vagueness may come  
31 from the fact that sharing is a relatively open concept: 'as the division and distribution  
32 of something – be it profits, goods or knowledge – amongst several people' (Hall and  
33 Ince 2018, p.4). Moreover, there are questions about what is being shared, and how:  
34 for 'we can share not only places and things, but also people and animals (to the extent  
35 they are ours to share), as well as our ideas, values, and time' (Belk 2007, p.127). As a  
36 result, the sharing economy takes on a limitless capacity, with the potential to be  
37 applied to many elements of social, political and economic life.  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Slippages in use and understanding also come into play when considering the  
4  
5 difference between 'sharing economies', 'sharing and economies', and 'the sharing  
6  
7 economy' which are important for our positioning here. For 'although *the* sharing  
8  
9 economy might be considered a contemporary phenomenon [...] it is not the only way  
10  
11 that sharing and the economy intersect' (Hall and Ince 2018, p.4). As Frenken and  
12  
13 Schor (2017, p.3) articulate:  
14  
15

16  
17  
18  
19 'One reason is due to a common misconception about the sharing economy: its  
20  
21 novelty. Participants in the sharing economy employ a discourse of trendiness,  
22  
23 technological sophistication, progress and innovation. However, this  
24  
25 characterization betrays both class and race myopia, as well as what historians  
26  
27 call "presentism," or blindness to the past. Humans have always shared.'  
28  
29  
30  
31  
32

33 This is not to say that sharing economies do not offer any capacity for prefigurative  
34  
35 political formation. Rather, that sharing economies are not especially new or extra-  
36  
37 ordinary, but are part of a whole array of long-standing everyday economic  
38  
39 encounters (Belk 2010, Round et al. 2008, Stenning 2005). Values of gifting, caring,  
40  
41 collaboration, collective sentiments and intersubjectivity are also often interlinked  
42  
43 with sharing, part and parcel of economic practice (e.g. Banks 2006, Hall 2011, Jones  
44  
45 and Murphy 2010), that are lost in current conceptualisations of sharing economies as  
46  
47 *exceptional*. The empirical case presented in this paper highlights the everyday and  
48  
49 rather mundane nature of making in the Makerspace.  
50  
51  
52  
53  
54  
55

56 In seeking further clarity, Belk (2007, p.126), argues that 'sharing is an alternative  
57  
58 form of distribution to commodity exchange and gift giving. Compared to these  
59  
60

1  
2  
3 alternative modes, sharing can foster community, save resources, and create certain  
4 synergies'. This is a popular position occupied by numerous contemporary theorists,  
5  
6 that sharing offers an economic alternative, and is perhaps why FabLabs as ethos and  
7  
8 spaces have become synonymous with alternative economic practices. Positioning  
9  
10 sharing as an alternative economic principle is, however, somewhat a hasty and  
11  
12 misleading assumption. Indeed, as Hall and Ince (2018, p.2) comment, 'some of the  
13  
14 most powerful examples of sharing economies are the everyday, informal practices of  
15  
16 mutuality, solidarity and resourcefulness that all-too-easily go unnoticed'. Frenken  
17  
18 and Schor (2017, p.3) elaborate on this point when they state that 'the sharing  
19  
20 economy is creating enormous amounts of wealth, and that it has been using a  
21  
22 socially-progressive feel-good rhetoric to do so'.  
23  
24  
25  
26  
27  
28  
29  
30

31 Similar to critiques of moral economies, sharing economies may be argued to have  
32  
33 limited capacity to work as true alternatives to capitalism modes of production and  
34  
35 consumption because they operate within the very systems they (are presumed to)  
36  
37 seek to reinvigorate or counteract. Furthermore, sharing is often posited as a  
38  
39 'ubiquitous consumer behaviour [...] more characteristic of the interior world of the  
40  
41 home rather than the exterior worlds of work and the market' (Belk 2010, p. 716). In  
42  
43 this case, it would be difficult to envisage how and where sharing can offer radical  
44  
45 economic alternatives, if its political potential is limited to consumption practices.  
46  
47 Thus, like Frenken and Schor (2017, p.3), 'we believe it is crucial we start asking  
48  
49 [questions about sharing economies] in a more analytical, empirical and critical  
50  
51 manner'.  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 In light of new technologies, mediums and interfaces for sharing as economic practice  
4  
5 - what Belk (2014, p.1595) calls 'phenomena born of the Internet age' - there has been  
6  
7 a notable shift in geographers' attention in recent years towards the capacities of  
8  
9 sharing economies. Examples such as Airbnb, Zipcar, Wikipedia, YouTube, Flickr,  
10  
11 Facebook, Freecycle, and Twitter (Belk 2014, p.1595) are becoming regular features  
12  
13 in geographical writing of sharing economies (see Ince 2016, Richardson 2015,  
14  
15 Roelofsen 2018). Albeit, this is not to say that geographers do not engage in further  
16  
17 critical work beyond digital platforms. Richardson (2016), for instance, has written of  
18  
19 shared working and coproduction in creative writing practices, and co-working offices  
20  
21 (Richardson 2017). Likewise, housing remains a staple of geographical research  
22  
23 interest in sharing (and) economies, including digitally mediated house sharing  
24  
25 (Maalsen 2018), hospitality platforms for home sharing (Hellwig et al. 2018),  
26  
27 collaborative housing (Sargisson 2018) and extended family households (Gibson et al.  
28  
29 2018). Furthermore, in a recent collection on *Sharing Economies in Times of Crisis*,  
30  
31 examples of sharing economies written from a geographical perspective include seed-  
32  
33 saving (Pottinger 2018), to indigenous land claims (Gombay 2018), illuminating what  
34  
35 the editors argue to be 'the ambiguous practices, politics and possibilities running  
36  
37 through sharing economies' (Hall and Ince 2018, p.11). This paper highlights the  
38  
39 wealth of unanswered questions on sharing, particularly around the ways in which  
40  
41 sharing practices begin and are sustained, how/if those who share develop a collective  
42  
43 vision or set of ideals around the why, what and how of their sharing practices and the  
44  
45 barriers to sharing. Here we use the Manchester case study to interrogate the often  
46  
47 implicit assumptions around sharing and the expectations of the sharers.  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57

## Making and consumption

Current geographical literature appears to offer limited concerted engagement with sharing economies beyond ideals or practices of consumerism; that is, writing on sharing economies of making, production and manufacturing remains quiet (see Richardson 2016). This is perhaps unsurprising, given that since the ‘Cultural turn’ in the 1980’s, consumption has been celebrated as a source of fulfilment, veering from dominant economic perspectives that place production as more important than consumption (Driver and Martell 1999). As a result, there has been a steadily increase in academic works on this subject, paralleling the consumer boom of the 1980s (Goss 2004). Terms such as ‘produser’ (Bruns, 2008), ‘co-creation’ (Prahalad and Ramaswamy, 2004; Ramaswamy and Ozcan (2014) and ‘prosumption’ (Troffler, 1980; Ritzer, 2014; Ritzer et al., 2012; Ritzer and Jurgenson, 2010) have emerged in order to combine the interrelated processes of production and consumption.

Prosumption is a generic process that subsumes production and consumption into a wide range of processes that exist along a continuum (Ritzer, 2014), intensifying in the Internet age (Ritzer and Jurgenson, 2010) and has parallels with the idea of makers as consumers and producers (more below). For Bruns (2008) consumers can become cultural producers and distributors, bypassing traditional organisations leading to ‘produsage’. This mixture of production and use has shifted from the factory to society (Negri, 1998) and is supported by ‘free labour’ (Terranova, 2004).

However, situating all economic practices of consumption and production as simultaneously prosumption does not serve to fully address the nuances of these practices in situ (see Sayer 2003). We contend that these concerns have been

1  
2  
3 elucidated within recent writing on the geographies of craft and making, which seek  
4  
5 to critically approach the spaces between production and consumption as an area in  
6  
7 need of further exploration. Economic geographers are thought to have been  
8  
9 preoccupied with product lifecycles, biographies and social lives (see Smith et al  
10  
11 2002) at the expense of understanding everyday economic practices of making (see  
12  
13 Carr and Gibson 2016, Hall and Jayne 2016, Holmes 2015, Price and Hawkins 2018).  
14  
15  
16  
17  
18

19 It is posited that reframing discussions around *making*, in particular, makes way for  
20  
21 thinking beyond the monetary value of products and their use, to develop a more  
22  
23 complex interpretations of relationships between/within production and consumption.  
24  
25 For Carr and Gibson (2016, p. 299) this reframing allows for a move away from  
26  
27 presumptions and binaries of 'small-scale "craft" and large-scale "manufacturing"',  
28  
29 towards 'a focus on making (as disposition and practice across and within both scales  
30  
31 and modes of production)'. Price and Hawkins (2018, p.15) likewise identify a  
32  
33 'diverse patchwork of sites at which making takes place', within which there is an  
34  
35 'interweaving of the professional and amateur' (p.17), where people seek 'material and  
36  
37 mental solace from busy consumer worlds' (p.15). Furthermore, and importantly for  
38  
39 our discussion, Carr and Gibson (2016, p.299) contend that 'the semantic and  
40  
41 ontological shift from manufacturing and craft towards making is an attempt to  
42  
43 reframe debate about 'economy' [...] to capture the need to move onwards from the  
44  
45 modern capitalist paradigm of profit-driven, high-throughput production of physical  
46  
47 things'. The suggestion here is that a focus on geographies of making lends itself to  
48  
49 alternative, 'counter-cultural' economic practices and formation (ibid, p.299). Again,  
50  
51 we come to a familiar impasse - that making and alternative economic practices are  
52  
53 assumed to be based on an alternative ethos or social formation; an all too easy elision  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 of sharing and making. We contend that this vision is also reductive and uniform,  
4  
5 leading us to question the degree to which a plurality of views on making can coexist  
6  
7 or even compete within makerspaces. The maker community is diverse and individual  
8  
9 makerspaces are local spaces of making and sharing, whilst also embedded in local  
10  
11 economies and wider maker networks. However, extant literature does not currently  
12  
13 extend our understandings of the degrees of such embeddedness, nor the implications  
14  
15 for the outcomes of making and sharing.  
16  
17  
18  
19  
20

21  
22 With this paper we aim to develop these critical theoretical reflections on digital  
23  
24 fabrication, sharing and making, through the empirical example of the Manchester  
25  
26 FabLab. We are particularly interested in how, and if, values and practices of making  
27  
28 and sharing are manifest in the daily workings of the FabLab as a microcosm for  
29  
30 understanding economic geographies in action. The focus of our analysis, as derived  
31  
32 from our review of existing literature, is upon the ways in which the FabLab  
33  
34 community has developed ideas and visions of sharing and their common  
35  
36 understandings of their making practices, the embeddedness of the Manchester  
37  
38 FabLab in wider networks of making and sharing, and the obstacles to sharing. We  
39  
40 now describe the research study upon which our findings are based.  
41  
42  
43  
44  
45  
46

### 47 **3. Methodology**

48  
49 Our case study, the Manchester FabLab, was selected for several reasons; it was first  
50  
51 FabLab established in the UK; it had high levels of reported users; between opening  
52  
53 in March 2010 and 2014 over 11,000 individuals visited the lab (Manufacturing  
54  
55 Institute, 2015); and the site had many days open to the public each week. The  
56  
57 FabLab was funded by a consortium of organisations including the Manufacturing  
58  
59  
60

1  
2  
3 Institute, National Endowment for Science, Technology and the Arts (NESTA), the  
4  
5 Manchester Innovation and Investment Fund, and the Manchester Knowledge Capital  
6  
7 organization. The Manchester FabLab was located in the Chips building, a new  
8  
9 flagship mixed-use building in the recently regenerated area of New Islington  
10  
11 (historically part of Ancoats, the heart of the manufacturing district in industrial  
12  
13 Manchester). Surrounded by canals on three sides, and facing a derelict industrial  
14  
15 warehouse, the Manchester FabLab presented itself as the epitome of the digital post-  
16  
17 industrial era.  
18  
19  
20  
21  
22

23  
24 The initial consortium funding covered only the initial three years of the Manchester  
25  
26 FabLab and the lab developed a funding model that was heralded – within the Fab  
27  
28 Foundation network – as particularly sustainable. In practice, the FabLab was  
29  
30 supported by the Manufacturing Institute, a UK-based charity funded by  
31  
32 manufacturers which works with companies to improve skills and productivity, and to  
33  
34 preserve the historical legacy of manufacturing in the UK. A primary motivation of  
35  
36 the Manchester FabLab was to provide free access to the tools to make things. The  
37  
38 FabLab opened three or four days a week to the public, for free without membership  
39  
40 fees and additional commercial days in which businesses paid to use the equipment  
41  
42 and staff resources. The Manchester FabLab business model was therefore based on  
43  
44 support from the Manufacturing Institute and income generated by providing  
45  
46 consulting and prototyping for commercial businesses.  
47  
48  
49  
50  
51  
52

53  
54 Our research methodology utilised a mixed-method approach, using ground field  
55  
56 research methods (Auderbach and Silverstein, 2003). We combined semi-structured  
57  
58 interviews and participant observation as part of a reflexive methodology that  
59  
60

1  
2  
3 responded to the challenges of the research context; gaining access and trust and  
4  
5 developing knowledge of the digital 'fab' technologies. As such, the empirical  
6  
7 research was conducted in three stages. First, several key individuals in the Fab  
8  
9 Network were approached to gain permission to research in the Lab and for interview.  
10  
11 This provided a broad oversight of both the Fab movement and the positionality of the  
12  
13 Manchester FabLab within the Fab Foundation. Second, time was spent in the  
14  
15 Manchester FabLab to increase familiarity with the digital technologies, to note how,  
16  
17 and by whom, the technologies were used in the FabLab and to observe general usage  
18  
19 levels and interactions between users - or what we herein refer to as 'makers' (see Carr  
20  
21 and Gibson 2016) - in the Lab. The Manchester FabLab was a relatively small, open-  
22  
23 plan area which facilitated observation. Third, semi-structured interviews were  
24  
25 conducted with FabLab makers. In total twenty-seven interviews were conducted  
26  
27 between July 2015 and May 2016 (see Table 1). Interviews lasted between one and  
28  
29 three hours and all were transcribed verbatim. Interview questions related to maker  
30  
31 backgrounds, usage of the lab (frequency, type of use, equipment used), knowledge  
32  
33 and use of digital technologies, the Maker Movement and entrepreneurial activity.  
34  
35 Interviews were conducted in the casual seating area of the FabLab.  
36  
37  
38  
39  
40  
41  
42  
43  
44

45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
Visits to the FabLab occurred on different days of the week, each visit for a minimum  
of two hours, often longer. During these visits both interviews and participant  
observation were conducted and observations recorded in a field diary. The total  
number of participant observations hours totalled 90. The participant observation and  
interviewing informed each other. For example, participant observation highlighted  
the regular 'core' FabLab makers to be approached for interview, as well as the  
relatively high number of occasional or first-time makers.

1  
2  
3  
4  
5 The interview and observation data were analysed using both manual coding and  
6 NVivo analysis software. We identified the initial, first-order, codes for analysis.  
7  
8 This revealed a wealth of data on sharing which emerged from the data rather being a  
9 defined research question during the research design and execution. In consequence  
10 we revisited 'sharing' codes and devised an expanded set of sub-codes to interrogate  
11 and reanalyse the data. This was an additional layer of free-hand inductive analysis  
12 whereby coded data extracts were analysed and aggregate theoretical dimensions  
13 identified. These theoretical dimensions formed the basis for presenting our analysis  
14 in Section 4 below.  
15

#### 29 **4. Findings: making and sharing in Manchester's FabLab**

30 Our data on sharing economies in the Manchester FabLab emerged organically. The  
31 interview and participant observation data yielded some unexpected findings on the  
32 realities of sharing economies in a makerspace. The processes of analysis have  
33 revealed three key themes, structuring the arrangement of our findings below.  
34  
35  
36  
37  
38  
39  
40  
41

##### 42 **4.1. Envisioning sharing and making in the FabLab**

43 Throughout the interviews and field discussions, the 'idea' or 'vision' of and for  
44 sharing in the FabLab was a prominent topic of conversation. The language of  
45 imaginaries, dreams and hopefulness came through strongly in participant's narratives,  
46 conveying a somewhat romantic, even fantastical vision of what the FabLab may (or  
47 ought to) have been or become.  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57

58 Matthew: I was telling an older student about a project I was trying to make  
59  
60

1  
2  
3 with Arduino, and he said "have you heard about FabLab? It's a great place  
4  
5 where you can make things".  
6  
7  
8  
9

10 Harvey: At the moment it is about people being evangelical about it.  
11  
12 Spreading their thoughts about it, saying to friends and family 'have you seen  
13  
14 what I can do?' Like every time I tell friends about it, they are always amazed;  
15  
16 and they think that it is great. But then they never seem to follow up on it.  
17  
18  
19

20  
21 In theory, then, the FabLab was held up to be a 'great place', one that participants  
22  
23 relished telling their friends and strangers about, sometimes in a bid to convert them  
24  
25 to being a user of the space. There was a sense that participants felt the success of the  
26  
27 FabLab depended on how well propagated the ideas were. And yet there was very  
28  
29 little substance in this personal marketing ('where you can make things'). Nor did their  
30  
31 efforts come to much, because - and this was a regularly identified trend in the data -  
32  
33 the people they told 'never seem to follow up on it'.  
34  
35  
36  
37  
38  
39

40 As noted earlier, sharing ideals and principles are often critiqued as sitting somewhat  
41  
42 apart from the economic reality of sharing in practice (Frenken and Schor 2017), and  
43  
44 the Manchester FabLab was no exception. However, as work on geographies of  
45  
46 making also identifies (Carr and Gibson 2016, Price and Hawkins 2018), this criticism  
47  
48 is typically levelled at economies of scale, rather than those which are more localised  
49  
50 and individualistic. Typically, close physical proximity is taken as synonymous with  
51  
52 visible and regulated production practices, of being close to and with materials (Hall  
53  
54 and Jayne 2016, Price and Hawkins 2018). And yet, when it came to realising  
55  
56  
57  
58  
59  
60

1  
2  
3 everyday sharing and making within the FabLab, participants went out of their way to  
4  
5 identify how the dream and reality shaped up.  
6  
7  
8  
9

10 In fact, many narratives typically pivoted on the crucial 'but' (as italicised below),  
11  
12 indicating this short-fall of expectation:  
13

14 Paul: *What this lab lacks*, which would be a must if you were opening a new  
15  
16 one, is a space where you can make a bit of a mess and use manual tools. So it  
17  
18 is nice that everything is tidy and carpeted and cleaned, roughly, *but* the  
19  
20 manufacturing process means you need to hit things with a hammer  
21  
22 sometimes, you need to make a mess and not worry about everything being  
23  
24 clean and tidy.  
25  
26  
27  
28  
29

30 Phil: We just had a deal...with the Ultimaker company. They produce what I  
31  
32 call consumer 3D printers, so desktop 3D printers. The people who designed  
33  
34 that were the founders of the FabLab in Utrecht. They have created a  
35  
36 worldwide business out of these machines. *But* they [Utrecht as opposed to  
37  
38 Manchester FabLab] have a very open philosophy.  
39  
40  
41

42 There was a sense that the Manchester FabLab always fell short of the dream, that it  
43  
44 did not quite fulfil its potential as a space of alterity and altruism, a counter-cultural  
45  
46 hub of sharing and innovating (Carr and Gibson 2016, Frenken and Schor 2017). It  
47  
48 was also typically discussed in relation to the comparative success of other FabLabs  
49  
50 across Europe, particularly Barcelona and Utrecht. This also works against the  
51  
52 discourse of a shared vision or goal within the FabLab 'community' (Davies 2017,  
53  
54 Wolf et al 2014), where instead these maker spaces were being characterised by  
55  
56 competition, of a money vs. markets economy (Sayer 2003).  
57  
58  
59  
60

1  
2  
3  
4  
5 There was less awareness, however, of the rather different business models  
6  
7 underpinning those Fablabs which have less free, open time for the public. According  
8  
9 to Phil, this meant that if an idea was developed in Manchester, 'someone in a FabLab  
10  
11 in Nairobi, for instance, can then take that idea and then either improve it or replicate  
12  
13 it for themselves and reproduce it using that write up'. However, in all discussions  
14  
15 concrete, tangible examples of this shared form of working were very thin on the  
16  
17 ground (also see Wolf et al. 2014), and participants rarely cited instances of where  
18  
19 these visions had been seen through. The technologies enable sharing across  
20  
21 geographical spaces, and the umbrella organisation, the Fab Foundation actively  
22  
23 encourages such sharing, yet there was a presumption that the FabLab model does  
24  
25 work, because they willed it to work. The Fab Charter makes it clear what is expected  
26  
27 of makers, but this is interpreted as an ideal rather than an everyday practice.  
28  
29  
30  
31  
32  
33  
34

35 As already suggested, an additional observation within the data was around the plural,  
36  
37 competing and in many way contradictory demands within the FabLab. Individualistic  
38  
39 demands and norms emerged strongly within some participants' narratives (Sayer  
40  
41 2003). For example:  
42  
43

44 Peter: I think the hardest thing is explain to people why I do this for free.

45  
46 Because all this, economical presumptions people have in terms of why you  
47  
48 have to work for money, or work to get a career, and all this. Why are you  
49  
50 spending so much time on open source for others to use?  
51  
52

53 Ken: Classical economics dictates that resources are scarce, but information  
54  
55 and technology isn't like that. When you share it, people learn about it. If  
56  
57 anything their ability to contribute grows and I think it is that complete  
58  
59  
60

1  
2  
3 opposition to classical economics through the internet that makes these things  
4  
5 possible.

6  
7 Paul: Because people realise it is a service that has been given for free, the sort  
8  
9 of people who come here are just so appreciative that even if they might be  
10  
11 frustrated by a system, or something not going right, you are giving me this for  
12  
13 free, so if I don't like it, I can just go or stay. And I think that people have got  
14  
15 the right attitude in that, users are not held to account like you are if you pay  
16  
17 for a service.  
18  
19

20  
21 In each of these extracts, the ethos of the FabLab is discussed in direct contrast to  
22  
23 'economical presumptions' and 'classical economics', offering a prefigurative  
24  
25 alternative to commodification (see Belk 2007).  
26  
27

28  
29 FabLab makers expressed what they considered to be 'counter-culture' viewpoints  
30  
31 (see Carr and Gibson 2016), often referring to *themselves* as 'makers', or even 'post-  
32  
33 makers' (users who have evolved to be able to critique maker rhetoric). Several  
34  
35 participants who obtained an income from making and selling items strongly denied  
36  
37 that they were entrepreneurs, preferring instead to identify their making as amateur  
38  
39 and experimental (Price and Hawkins 2018). However, these 'alternative' views are  
40  
41 frequently contradicted by much of the interviewees' discussions of their lives,  
42  
43 livelihoods and activities in the FabLab. For example, Peter, who argued so strongly  
44  
45 for open source sharing has patented and commercialised two products to financially  
46  
47 support himself; Alex, who only now describes himself as an entrepreneur having left  
48  
49 the FabLab and Steve, who uses the FabLab to make 3D printers which is he sells  
50  
51 commercially (including to the Manchester FabLab).  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 While participants expressed that they were trying to work against the grain of  
4  
5 socialised and cultural norms of capital accumulation and profit-making (see Carr and  
6  
7 Gibson, 2016), this was also deemed important to the vision and ethics of the FabLab.  
8  
9 It was taken as a given that 'of course' (Ken) people help one another in the Lab,  
10  
11 making 'it a welcoming space, as relaxed as possible' (Paul). Furthermore, a number  
12  
13 of participants were forceful in their rejection of key principles such as ownership,  
14  
15 property rights and intellectual property, claiming:  
16  
17

18  
19 Ryan: that is my philosophy, share information and I don't like corporate  
20  
21 greed. I don't like, the thought of making money out of something sickens me  
22  
23 to be honest.  
24  
25

26  
27  
28 Martin: I don't want to make and sell stuff, I want to create designs and  
29  
30 release them open source and see what people make of them.  
31  
32

33  
34  
35 Jason: Intellectual property is a disaster. It has caused more damage to  
36  
37 humanity than almost anything else.  
38  
39

40 Participants' impassioned claims about a rejection of 'corporate greed', 'sell[ing] stuff'  
41  
42 and 'intellectual property' were key to an ethos of the FabLab being not-for-profit  
43  
44 (also see Belk 2007, Carr and Gibson 2016, Sayer 2003). These claims mirror the  
45  
46 underlying principles of the Maker Movement rather than the specific themes of the  
47  
48 Fab Charter. The Charter states 'designs and processes developed in FabLabs can be  
49  
50 protected and sold however an inventor chooses, but should remain available for  
51  
52 individuals to use and learn from' (Fab Foundation, 2012). Here FabLab makers were  
53  
54 expanding upon the basic 'rules' of the Fab Charter to incorporate their own  
55  
56 philosophies and viewpoints, but did so unevenly. Taking these findings on shared  
57  
58  
59  
60

1  
2  
3 visions, principles and ideals, next we pay further attention to the context of the  
4  
5 FabLab and the tangibility of what was being (or aspired to be) shared.  
6  
7  
8

#### 10 **4.2 Spaces of sharing in and beyond the FabLab?**

11  
12  
13

14 Contemporary perspectives on makerspaces suggest that these spaces are nodes within  
15 a larger community of making (Suire 2019; Schmidt 2019). At the time of the  
16 research, there was only one other makerspace in Manchester. The Manchester  
17 FabLab makers emphasised that the FabLab was different to that makerspace:  
18  
19  
20  
21  
22

23 ‘What the process is, so that is what makes the FabLab quite unique really.

24 Because people being able to just come in, do a 20 minute health and safety  
25 and then jump on a laser cutter or CNC machine and then you know, there is  
26 no other place you can do that’ (Martin)  
27  
28  
29  
30  
31  
32

33 FabLab makers conveyed a sense of superiority about other makerspaces, citing the  
34 more advanced technology in FabLabs and more pleasant, ‘less grubby’ (Matthew)  
35 working environment. This was also related to the origins of the makerspaces, with  
36 FabLab makers appearing to benefit from external validation of their activities: ‘yes,  
37 well, they [FabLabs] generally get funding whereas other Makerspaces don’t’ (Jason).  
38  
39  
40  
41  
42  
43  
44  
45  
46

47 When asked about how they engaged with the makers in the other Manchester  
48 makerspace, the FabLab makers explained that they did not visit the other space (nor  
49 vice-versa) mainly because of cost:  
50  
51  
52

53 ‘The only other place is a Manchester Makerspace over there....[points] but  
54 that is a paying thing. My income is pretty low so I try to avoid paying for  
55 things’ (Jason)  
56  
57  
58  
59  
60

1  
2  
3           ‘There is HackMan, that has a far, far, better set up. But I don’t go there  
4  
5           because it is subscription. That is the only reason, purely financial’ (Mark).

6  
7  
8 No interviewees articulated that the Manchester FabLab was preferable to other  
9  
10 makerspaces on any grounds other than being a free resource. They did not cite any  
11  
12 differences in the types of activities taking place, nor in the functioning and outcomes  
13  
14 of the two maker communities. This disconnection from other activities was mirrored  
15  
16 in the positioning of the Manchester FabLab in the wider city ecosystem.

17  
18  
19           ‘We have no formal connections outside the FabLab, no. We have informal  
20  
21 connections, I mean, we work with all the universities. The Manufacturing  
22  
23 Institute, its founders were the universities and the large businesses in Trafford  
24  
25 Park anyway. We don’t connect people to business support agencies, no’  
26  
27  
28 (Phil).

29  
30  
31 There were therefore few mechanisms by which FabLab makers could share and  
32  
33 collaborate beyond the FabLab due to the paucity of connections to other makerspaces  
34  
35 and local institutions. Business support agencies were not invited to visit or support  
36  
37 the Manchester FabLab due to the lack of commercial activity taking place, and the  
38  
39 general reticence of the makers to do so (as discussed in Section 4.1). Engagement  
40  
41 with local universities was predominately through students using the FabLab during  
42  
43 peak times in the semester when university facilities were booked (source: fieldwork  
44  
45 diary).

46  
47  
48  
49  
50  
51 Similarly, when participants discussed social relations specifically within the  
52  
53 Manchester FabLab - as an outcome of sharing economies regularly identified within  
54  
55 literature, a space for meaningful encounters (see Belk 2010, Stenning 2005) - there  
56  
57  
58  
59  
60

1  
2  
3 was a notable absence and interesting use of language of solace (see Price and  
4  
5 Hawkins 2018). This extract from Ian's discussion with X, below, is a case in point:  
6

7 Ian: I'm running out of equipment to use at home, obviously there's a lot more  
8  
9 technical equipment out there that I can't afford to use. *I also like to meet*  
10  
11 *other people and to, what do they call that now?*  
12  
13

14 X: Networking?  
15

16 Ian: Networking! I wanted to network with people. But I have come down to  
17  
18 make stuff, but I like to listen to what other people have done. Just, to be  
19  
20 basically part of something, because you can feel very alienated when you are  
21  
22 working in your own studio at home, and if you don't *brush alongside* other  
23  
24 people, you don't learn as much because they have got talents that I might  
25  
26 need help with.  
27  
28  
29

30 Here, Ian talks about the FabLab as a place for making things as well as connections,  
31  
32 based primarily on the common feature of being physically near to other people.  
33

34 Tellingly, he describes these social encounters as 'networking' and 'brushing  
35  
36 alongside', each with loaded (as well as geographical and spatial) connotations, and  
37  
38 neither of which indicate 'genuine' friendships (see Hall and Jayne 2016). In fact, none  
39  
40 of the participants discussed meeting up outside the space of the FabLab, not even to  
41  
42 the bar four hundred metres down the road (Source: fieldwork diary). Nor did  
43  
44 existing makers approach and welcome new makers following their initial induction  
45  
46 to the FabLab (Source: fieldwork diary). In fact, the space was often quiet and still as  
47  
48 something of a stark comparison to the inspiring hustle and bustle presumed to fill  
49  
50 makerspaces (Gershenfeld, 2005).  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Furthermore, these social relations come secondary to, and potentially in the way of,  
4 participants' aims for pushing a product 'forwards'. Ian's comments resonate with  
5  
6 similar remarks made by other participants, such as Harvey. He describes how 'the  
7  
8 first three times I came I didn't even touch any of the machines, I just watched other  
9  
10 people, talk to them, watched what they did on the software'. Colin also spoke of how  
11  
12 he 'work(s) with Johnny a lot in the corner', again using a spatial metaphor to denote  
13  
14 distance, or at least a lack of closeness. Our participant observation revealed that  
15  
16 individuals worked in isolation and the only shared spaces (two tables with chairs)  
17  
18 were used for eating and drinking. Those individuals choosing to break to socialise  
19  
20 discussed contemporary issues and topics, never specific projects. Those discussions  
21  
22 were 'held one-to-one and in hushed tones' (Source: fieldwork diary). And Ken said of  
23  
24 his designs 'I've just downloaded the software that I need to use it on. So I can design  
25  
26 it all at home now'. So while skills and knowledge were occasionally being shared,  
27  
28 the lab can not confidently be described as a space or interface of sharing (e.g. Belk  
29  
30 2014, Richardson 2017, Roelofsen 2018), but more as a nodal point of momentary  
31  
32 contact.  
33  
34  
35  
36  
37  
38  
39  
40  
41

42 This lack of a sharing environment and meaningful sharing relations was something  
43  
44 that participants were all too familiar with. Mark, a highly qualified IT engineer, even  
45  
46 described how the Lab was actively trying to encourage collaboration, though again  
47  
48 there is a Freudian slip in his choice of language towards the end of the extract (in  
49  
50 italics):  
51  
52

53 Lloyd: I look at some of these other FabLabs and look at what they are  
54  
55 producing. They are producing stuff that is big and clearly more impressive  
56  
57 than what we are doing here and I am really interested in structures that allow  
58  
59  
60

1  
2  
3 for that. So to me....we are opening on Thursday afternoons, evenings and all  
4  
5 anyone is *allowed* to do is collaborative work. So it is *a way of enforcing*  
6  
7 *collaborative work*.  
8  
9

10 The notion of 'allowed' and 'enforced' collaboration seems somewhat of an oxymoron,  
11 particularly in an environment that espouses to be welcoming, creative and open.  
12  
13 Indeed, there was often an emptiness, even sadness to the way participants described  
14 the space and use of the Lab: as a 'shell room' (Warren), for 'multi-usage' (Heidi),  
15 where 'the mindset is about individual work' (Lloyd), a place to 'pass information  
16 backwards and forwards' (Ian), and sharing as a 'culture [that] doesn't exist here'  
17 (Colin). In an interview with Mario, a college lecturer, he discussed - and without a  
18 hint of sarcasm - that he wanted to make PCBs [printed circuit boards], and 'there was  
19 one guy using it but he was busy at the time, so I spent all day and I learnt how to use  
20 it one day only from the youtube videos'. The imagine of Mario spending more time  
21 looking at his computer screen than engaging with other FabLab makers is a rather  
22 powerful one. So while participants spoke about how they would 'like to collaborate'  
23 (Colin) with others, this is as far as the collaboration went - in their talk.  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 In some instances, participants spoke openly, and more consciously, about the limits  
44 of their willingness and capacity to share their ideas and projects. For instance, Colin  
45 spoke of how 'my designs are my designs [...] if I want to develop my electric vehicle  
46 or develop my designs so I can start a business, I wouldn't put them online'. Ryan also  
47 implored: 'don't copy what I have done, improve it. If it can be improved'. Ken also  
48 described the social isolation we have also observed, in that 'nine times out of ten  
49 people are building their own projects and that project isn't linked in any way to any  
50 of the other projects that are going on'. Typically, FabLab makers were working in  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 their own isolated bubble, meaning the extent of the 'sharing' went only in so far as  
4 the materiality of the building and equipment, rather than sharing ideas, conversation  
5 or companionship (see Hall and Jayne 2016, Price and Hawkins 2018). One  
6 participant even expressed shock at the notion of sharing beyond these means:  
7  
8 'someone came in on Wednesday and they do an Aquaponics lab. It is bloody  
9 brilliant. It is the first instance here of people working together [he whispers this]'  
10 (Mark). That Mark whispers this gives a sense of a confessional, but also that it is not  
11 a view he wishes to share too widely. These claims sit very much at odds with the  
12 visions of the FabLab (or indeed maker movements more generally) identified  
13 previously, of sharing ideals and skills as a public good, rather than for private gain.  
14 This theme of limitations to the realities of sharing continues into the following  
15 section.

### 16 **4.3 Obstacles to sharing in the FabLab**

17 Sharing as economic practice is commonly posited as a way to save time, resources  
18 and energy, by working, residing or playing collectively (see Belk 2017). However,  
19 the FabLab was instead described by participants as a drain on key resources of time,  
20 energy and imagination. Ken, a quadcopter enthusiast, for example, described how he  
21 would 'be absolutely knackered if it wasn't for other people who knew what they were  
22 doing'. In particular, there was considered to be a limit as to how much time people  
23 could or would devote to helping and supporting the projects of others. Typically,  
24 time was considered an inflexible, precious and finite resource, and one that was also  
25 associated with profit:

Martin: I'm sure it wouldn't take too much time, some of the printing takes a  
long time so if I print something and it cocks up, I haven't got 6 hours to wait,  
so if I cock up it sets me back a week.

1  
2  
3  
4  
5 Nick: I have so little time and I just can't really find the motivation to go and  
6 sit in that kind of environment and just chat with people. I got shit I need to  
7  
8 do.  
9  
10

11  
12 However, this is not to say that a lack of time investment was considered an always  
13 reasonable explanation. Lloyd, for example, critically described how 'people are  
14 nervous of doing something wrong' and likewise Warren said "why should I go out of  
15 my way to do anything', that's their attitude from what I have gathered'. Ben  
16 described how, contrary to expectations, this attitude tended to be displayed least  
17 often by self employed members using the space, who 'have to look a bit more where  
18 the work is coming from' and yet 'are more out-going'. Rather than enabling an open  
19 platform for sharing skills and innovative knowledge, participants saw others as  
20 actively rallying against it.  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34

35 Perhaps as a direct result of a generally perceived lack of time to devote to helping  
36 and supporting others, when participants discussed their support of the FabLab this  
37 'giving back' tended to be quantified in financial terms. This, in many ways, sits at  
38 odds not only with the altruism of sharing and makerspaces, but also the FabLab  
39 model. *All* designs should be shared (although how is not directly specified in the  
40 FabLab Charter) yet our fieldwork observations and interviews yielded very few  
41 examples of this occurring. However, as Ryan and Phil describe in the following  
42 extracts, their ability to support the FabLab in this way was considered distinct,  
43 unusual and credible (emphasised with italics):  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54

55  
56 Ryan: I haven't paid for that yet! [Laughs] I do buy materials, I can buy them  
57 cheaper myself but a little bit of the profit from this goes back into the Fablab  
58  
59  
60

1  
2  
3 so, *it is giving back*.  
4  
5  
6  
7

8 Phil: So if you don't want to share, that is fair enough. But *you have to pay for*  
9 *the use of the lab*. The lab is being funded for people to share knowledge and  
10 create knowledge and grow that knowledge and build innovation. That works  
11 quite well. Obviously we do get the odd person who wants to get it free of  
12 charge and not share but we deal with that, as we do.  
13  
14  
15  
16  
17  
18

19 Time in the FabLab is divided in two: 1. Public - free to use, but with the requirement  
20 to share ideas and designs and 2. Private– time and expertise is charged at a fixed rate  
21 and ideas and designs are not shared. This causes makers to have clear ideas around  
22 what should and should not occur during 'their' public time. Commercial activities  
23 (for example, making goods to sell) are frowned upon as they drain resources by  
24 taking up too much time on the machines and the makers are unwilling to share their  
25 ideas and designs. However, our fieldwork observations did not reveal any attempts  
26 to enforce this, despite Phil's claims to the contrary. Nor did we see any clear  
27 instances of makers 'giving back', beyond examples such as bringing in milk for tea  
28 and coffee and Ryan's purchasing of materials from the FabLab.  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44

45 Makers such as Alex - who owns a successful international business based on a  
46 product developed in the Manchester FabLab – who are most able to 'give back' in  
47 terms of expertise and resources, articulated the necessity of returning to help, but  
48 then rarely do so. Commercialisation is seen as the beginning of the end of makers'  
49 relationship with each other and the FabLab, as makers aim to transition from 'maker'  
50 to 'entrepreneur':  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Alex: So, the start-up community in Manchester is vibrant, helpful, friendly  
4 and scrappy. It's not as well funded as the London ones, but the thing is, as  
5 soon as you give funding to the people, they often go off into their own  
6 offices.....And that actually creates a certain amount of insularity.....So then  
7 they stopped then inhabiting those shared working spaces, which are  
8 Makerspaces, FabLabs, other co-working spaces.  
9

10  
11  
12  
13  
14  
15  
16  
17 Rarely do these makers return to the FabLab. Warren stated that 'I don't go back very  
18 often [to the Manchester FabLab]. If I do it is to see a friend or talk to someone  
19 really'. He does not go back to share, whether sharing the space, his skills or his time.  
20  
21  
22  
23  
24  
25

26 Hence, the case of the FabLab raises questions about the scope for genuine altruism  
27 within makerspaces and localised sharing economies. In practice and in their  
28 narratives, participants placed profit at the core of their motivation. In the context of  
29 participants freely describing attitudes such as 'I want to make some money' (Warren),  
30 'the requirement to draw revenue' (Gideon), and patenting their ideas because they  
31 'thought it would be a good idea to make a little bit of money' (Martin), it is difficult  
32 not to situate personal and individualised motivations as an obstacle to sharing. When  
33 considering the 'success' of the FabLab, Alex, the only interviewee who described  
34 himself as a 'successful entrepreneur', measured this not according to the principles  
35 and visions discussed in 4.1 above, but rather according to individual and financial  
36 success: 'what you actually want is a FabLab populated by people who have  
37 successfully exited. That's your ideal. Who would have built a company, delivered  
38 and exited and are comfortable and have time on their hands'.  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49

51  
52  
53  
54  
55  
56  
57  
58  
59  
60

Similarly, Joyce, a furniture maker and regular at the FabLab, berated those makers

1  
2  
3 who did not see this as their ultimate mission:  
4

5           Joyce: They don't really commercialise their ideas, they come in to do like  
6  
7           Christmas cards, they come in and do wedding invitations and they do small  
8  
9           things like a box for something or a present for a friend.  
10  
11

12 There was a sense by some participants that makers were wasting the valuable time  
13  
14 and resources afforded by the space if they did not commercialise their ideas; as  
15  
16 Warren also expressed 'I can do better than this. Even if it is a toss room in a mill  
17  
18 somewhere'. There was a tendency to talk down the collaborative possibility that the  
19  
20 FabLab presented, seeing it not as exceptional or reciprocal (see Belk 2007, Wolf et  
21  
22 al. 2014) but as an extension of the market, a means of turning a profit and developing  
23  
24 entrepreneurial experience (see Banks 2006, Gernshenfeld 2005). The language of  
25  
26 rational, profiteering *homoeconomicus* seeped into the ideals, practices and future  
27  
28 envisioning of participants from the FabLab, as a space less for sharing and more for  
29  
30 individual innovation.  
31  
32  
33  
34  
35  
36  
37

## 38 **5. Conclusions**

39  
40  
41  
42 With this paper we have offered an empirically rich, critical perspective on sharing  
43  
44 and making in principle and in practice, using the example of Manchester's FabLab.  
45  
46 While the FabLab ethos professes a wholesome vision of collectivism, altruism and  
47  
48 sharing, of ideas, skills and things (Frenken and Schor, 2017), when we peel back the  
49  
50 layers of these assumptions we see prevailing norms of competition and  
51  
52 individualism. Not only were individual makers isolated within the space of the  
53  
54 Manchester FabLab, the lab itself was disembedded from the local economy. Much of  
55  
56 the rhetoric around maker movements and spaces like FabLabs is that they are a  
57  
58  
59  
60

1  
2  
3 means by which things are invented, tested and developed in and for the future. These  
4  
5 spaces are framed as innovative, collaborative economic spaces in which ‘magic’  
6  
7 happens, creating entrepreneurial opportunities and advancing society in general  
8  
9 (Gershenfeld, 2005; 2012). However, our findings show makers resisting  
10  
11 entrepreneurial rhetoric and the values espoused by the FabLab, of involvement,  
12  
13 connection and affinity (see Davies 2017, Doherty 2012), whilst also failing to engage  
14  
15 in sharing practices. While sharing is an ordinarily economic practice (Belk 2010,  
16  
17 Round et al. 2008), this does not mean it is always, inevitably or evenly employed by  
18  
19 economic actors and communities.  
20  
21  
22  
23  
24  
25

26 Furthermore, our findings also reveal some of the barriers and challenges to sharing in  
27  
28 this makerspace. In the Manchester FabLab sharing is limited in scope, and the  
29  
30 makers themselves revealed much about how they understand sharing and their use of  
31  
32 space while sharing (or not). This sits at odds with emerging literature on open  
33  
34 innovation spaces that assumes sharing is occurring (Hess, 2018), and with literature  
35  
36 on sharing economies that presumes sharing to be 'an alternative form of distribution'  
37  
38 (Belk 2007, p.126). Unpicking the lived realities of sharig and making in the FabLab  
39  
40 reveals these spaces to be much more complex than currently acknowledged.  
41  
42  
43  
44  
45

46 Perhaps the strongest evidence of these findings is that the Manchester FabLab closed  
47  
48 in early 2017. Throughout the research period Fab Foundation managers, Manchester  
49  
50 FabLab staff and makers highlighted concerns around the sustainability of FabLab  
51  
52 business models. After the closure Manchester FabLab moved its equipment to a  
53  
54 smaller FabLab located in a public library in Altrincham (a nearby very affluent  
55  
56 suburb). The Altrincham FabLab closed in November 2018. We argue that the  
57  
58  
59  
60

1  
2  
3 Manchester FabLab makers, through their resistance to *both* entrepreneurial and  
4 sharing values, actively undermined the makerspace ethos. Where made items are  
5 successfully commercialised, makers tend to leave the community without making a  
6 knowledge or resource contribution. Carr and Gibson (2016) argue that in order for  
7 making to reframe the economy it is essential that it moves away from modern  
8 capitalism and profit making, which is needed to collectively speak back to socio-  
9 environmental issues in a volatile world. However this 'solution' is undermined when  
10 individualism prevails. We suggest that this reframing of the economy requires both  
11 making and sharing to occur simultaneously.  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

26 It is clear that more critical insights into the day-to-day economic activities and  
27 sociabilities taking place in makerspaces is needed through more in-depth and  
28 comparative research. Such research might include experimental auto-ethnographic,  
29 participatory or digital/visual methods, to interrogate the experience of sharing  
30 economies and makerspaces as they are lived. If digital, open and sharing economies  
31 are where economies are moving towards, geographers should be placed at the centre  
32 of critical discourse about their form, function and futurity.

Table 1: Anonymised maker activities

<b>Maker</b>	<b>Maker demography</b>	<b>Making what</b>	<b>Making for</b>
Baxter	Male, white, 70s, British	Celtic designs on wood	Family, free art displays, friends
Colin	Male, white, 20s, British	Girlfriend makes beauty products; Colin and his Dad repair and modify household items	None is for commercial benefit.
Dom	Male, white, 20s, British	Plastic (3D printed) figurines for a promotional video	Himself and a friend – for their emerging business
Harvey	Male, white, 20s, British	Decorative map; lamps Mother made golf markers	Himself; mother made for her fiancé.
Ian	Male, white, 40s, British	3D models	College course, competitions etc.
Jason	Male, white, 70s, British	Variety of useful objects: gates, storage, signs.	Himself and friends.
Johnny	Male, white, 80s, British	A wide variety of things such as an electric bike.	Himself, other FabLab makers, friends.
Joyce	Female, white, 30s, Polish	Uses example of Christmas cards She has made jewelry, lamps and furniture	Family and friends. One piece of furniture was a wedding present.
Ken	Male, white, 50s, British	Parts for quadcopters	Himself and other members of his quadcopter club
Keri	Female, black, 20s, Ghanaian	Architecture student using equipment for her masters.	Herself - education
Lloyd	Male, white, 50s, British	All sorts, computer-based, electronics. Radio	Himself and friends
Mario	Male, white, 30s, Polish	Electronics, storage, engraved phone covers; customized T-shirts	Himself, his wife, friends and the college he works for; he also works at the Museum of Science and Industry
Mark	Male, white, 50s, British	Key ring Toys T-Shirts and hoodies	Family  Club
Martin	Male, white, 30s, British	Aquaponics i.e. pH controller, heat exchanger (retro-engineering products)	Everyone, esp. developing world

Matthew	Male, white, 20s, British	Makes commercial products – ideas initially developed in FabLab but are now commercialized. On day of interview he was making a ramp for Dachshund dogs. Also save-the-date cards for his sister’s wedding.	Commercial. Personal projects are for himself, friends and family.
Murphy	Male, white, 40s, British	T-shirts (vinyl)	Friends
Peter	Male, white, 30s, Brazilian	Aquaponics i.e. pH controller, heat exchanger (retro-engineering products)	Everyone, esp. developing world
Philip	Male, white, 18, British	3D printed figurines for games	Himself and family
Ryan	Male, white, 30s, British	Makes 3D printers	Himself. Commissioned to make a 3D printer for the FabLab (commercially)
Stephanie	Female, white, 20s, Spanish	Earrings and necklace	Sister and her friends
Warren	Male, white, 30s, British	Now makes 3D printers to sell. When in the FabLab he made components for 3D printers	Commercial
<b>Management</b>			
Charles	Male, white, 50s, British	Did not make in the FabLab	n/a
Gideon	Male, white, 40s, British	Did not make in the FabLab	n/a
Paul	Male, white, 30s, British	Worked on commercial projects and ad hoc assistance with public user projects	Businesses and makers
Phil	Male, white, 40s, British	Did not make in the FabLab	n/a
